

Tres Hombres 1 Project

Selva Alegra / Ketini, Peru

A Part of the Highlander / PRG - Tres Hombres Joint Ventures

Concession Holder: Highlander Mining Company S.A.C.

Hard Rock Mine Operator: Picchu Rio Gold S.A.

Preliminary Evaluation of Reserves/Production
from Highlander Mining Company's
Tres Hombres Concessions
Urubamba River Valley
Kiteni, Peru

October 7, 2013

The property contains 1800 hectares of land and is in full force and effect having paid yearly fees. The official lease number 010285709 and tax payment made on June 25, 2013 for \$1,800 US dollars.

After reviewing the sampling, pictures and description from several years ago by Ashworth and his team over 2000 feet higher up the mountain and recent analysis performed by Robert Miller with Thermo- Scientific Laboratories it is clear to the writer that this concession has immediate cash flow and great potential for producing gold, copper, silver and semi-precious minerals.

The recent road building on this concession by the Kiteni area government has exposed a fresh cross-section of this same mineralization that would have never been available to any geological team. The cut exposes over 500 horizontal feet of rocks with height over 120 feet and showing strong mineralization trend. This exposure is geologically complex and helps the value of the property in two ways: First, access to the mine is now available as of October 2013 and second, fresh rocks show mineralization. Before, the area could only have been accessed by foot with over 6 hours of vigorous hiking.

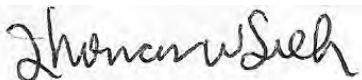

The exposure of fresh rocks in place showing skarns, veins by road building in mountainous inaccessible area has resulted in many new mines in the world and exploration of geology normally covered by soil or jungle and locating new gold and copper mines. Eskay Creek in Northern British Columbia a major gold district in 1990 and numerous mines in Papua New Guinea have been found in similar road building exposures in 1990's.

The Tres Hombres initial skarn (shown on attached photo) appears to be 500 feet wide, 200 feet in height and estimated to be over 200 feet deep. It appears that gold bearing molten rocks could have flowed in surrounding rocks perpendicular to the skarn/veining. These rocks will be much lower value but could be economic as well. The mining should work on this high value skarn to continue establishing commercial production and immediate production cashflow.

It is based on sampling in 2009, 2011, 2013 and reports of actual mining that this material should average 6 grams per ton gold and have estimated resource of 1,600,000 tons or 320,000 ounces of gold in place.

It is obvious that more detailed mapping/sampling needs to be done to determine the exact limits and whether there is higher value rocks and other significant mineral credits such as copper, silver and rare earth minerals. A small operation is obviously a very significant way to establish grades and get immediate cash flow. The brand new road cut on Tres Hombres confirms the staking on this concession many years ago and makes the investment in future operations a very safe investment.

Sincerely,

A handwritten signature in black ink, appearing to read "Thomas W. Sieh".

Thomas W. Sieh

Bachelor of Geology in 1969
University of South Dakota

Tres Hombres #1 Vein/Skarn #1

Oct. 2013 – Road cut exposing ore body and showing the Skarn/Veins thickness and height.

Reserves in this report are from this singular Skarn/Ore body, referencing the moving total visible mass to calculate 6 grams AU per ton, Direct vein ore extraction assayed at 1/3oz to 1-3/4 oz per ton.

6"

Tres Hombres II

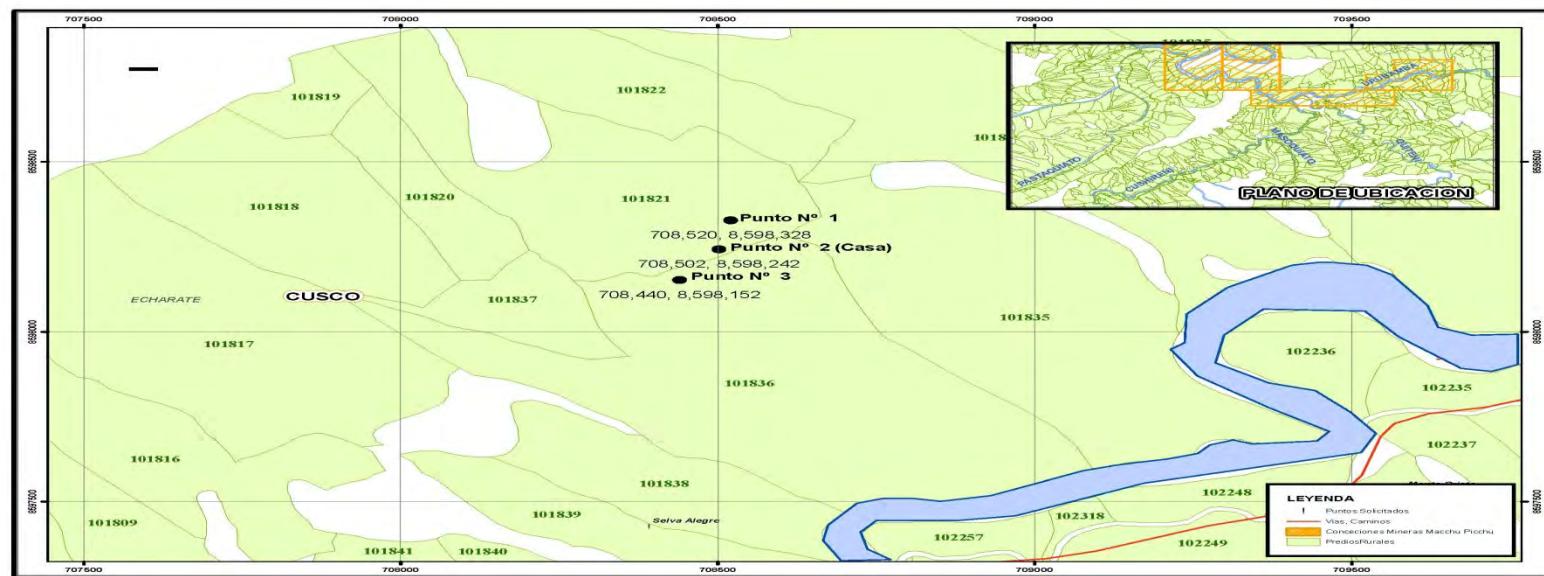

First Skarn/Vein -Tres Hombres 1

skarn/vein #1..Portion of the ore deposit referenced in report

15 tons of this part of the deposit moved for processing offsite

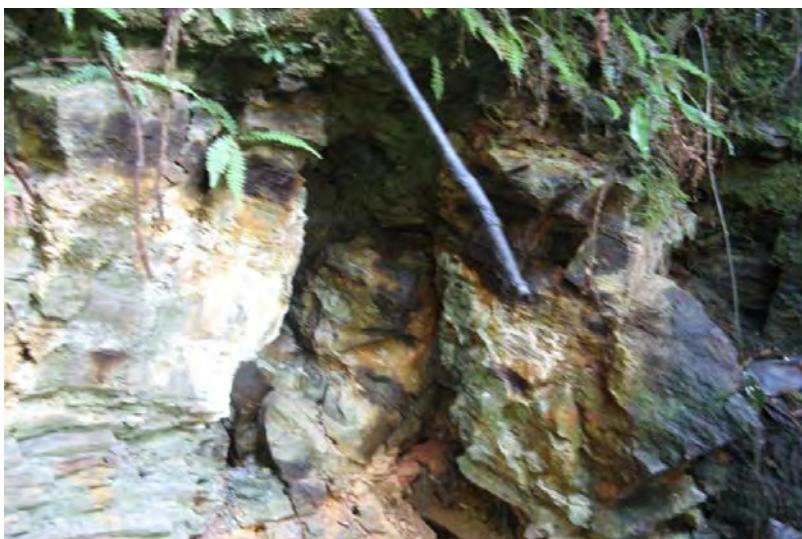

Tres Hombres 1

TRES HOMBRES I & II

Highlander Mining Company/PRG SA Tres Hombres Project

September 2013

Skarn/Veins #2

Skarn/Veins #2 Quartz and Carbon (Ba) containing 1) gold in metallic veins 2) micron and spider vein gold

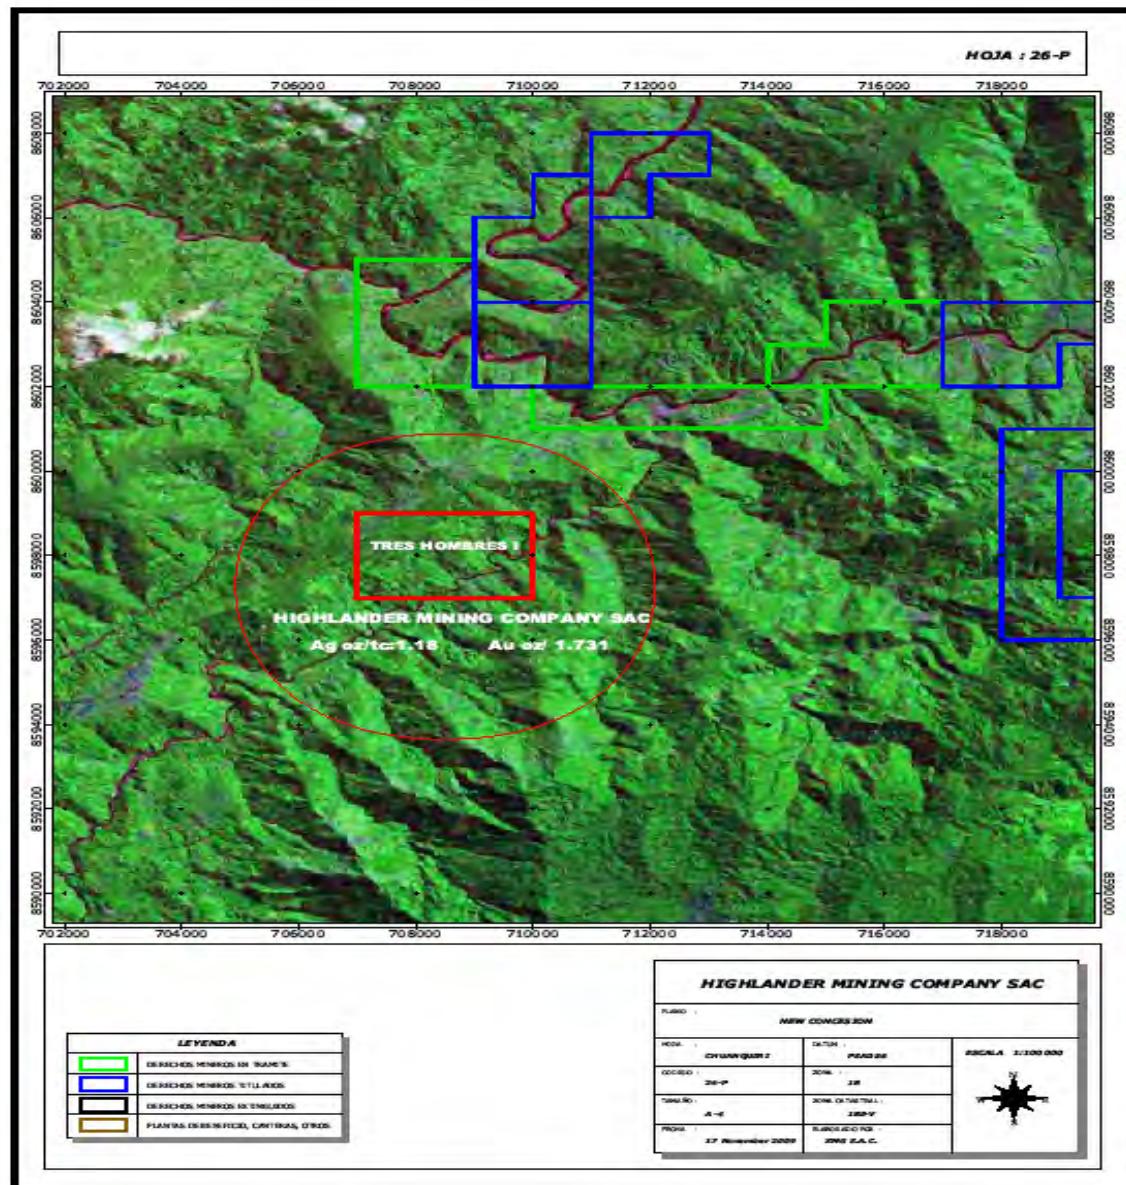

Vein/Skarn #3 Fe & Ba containing gold- silver ore

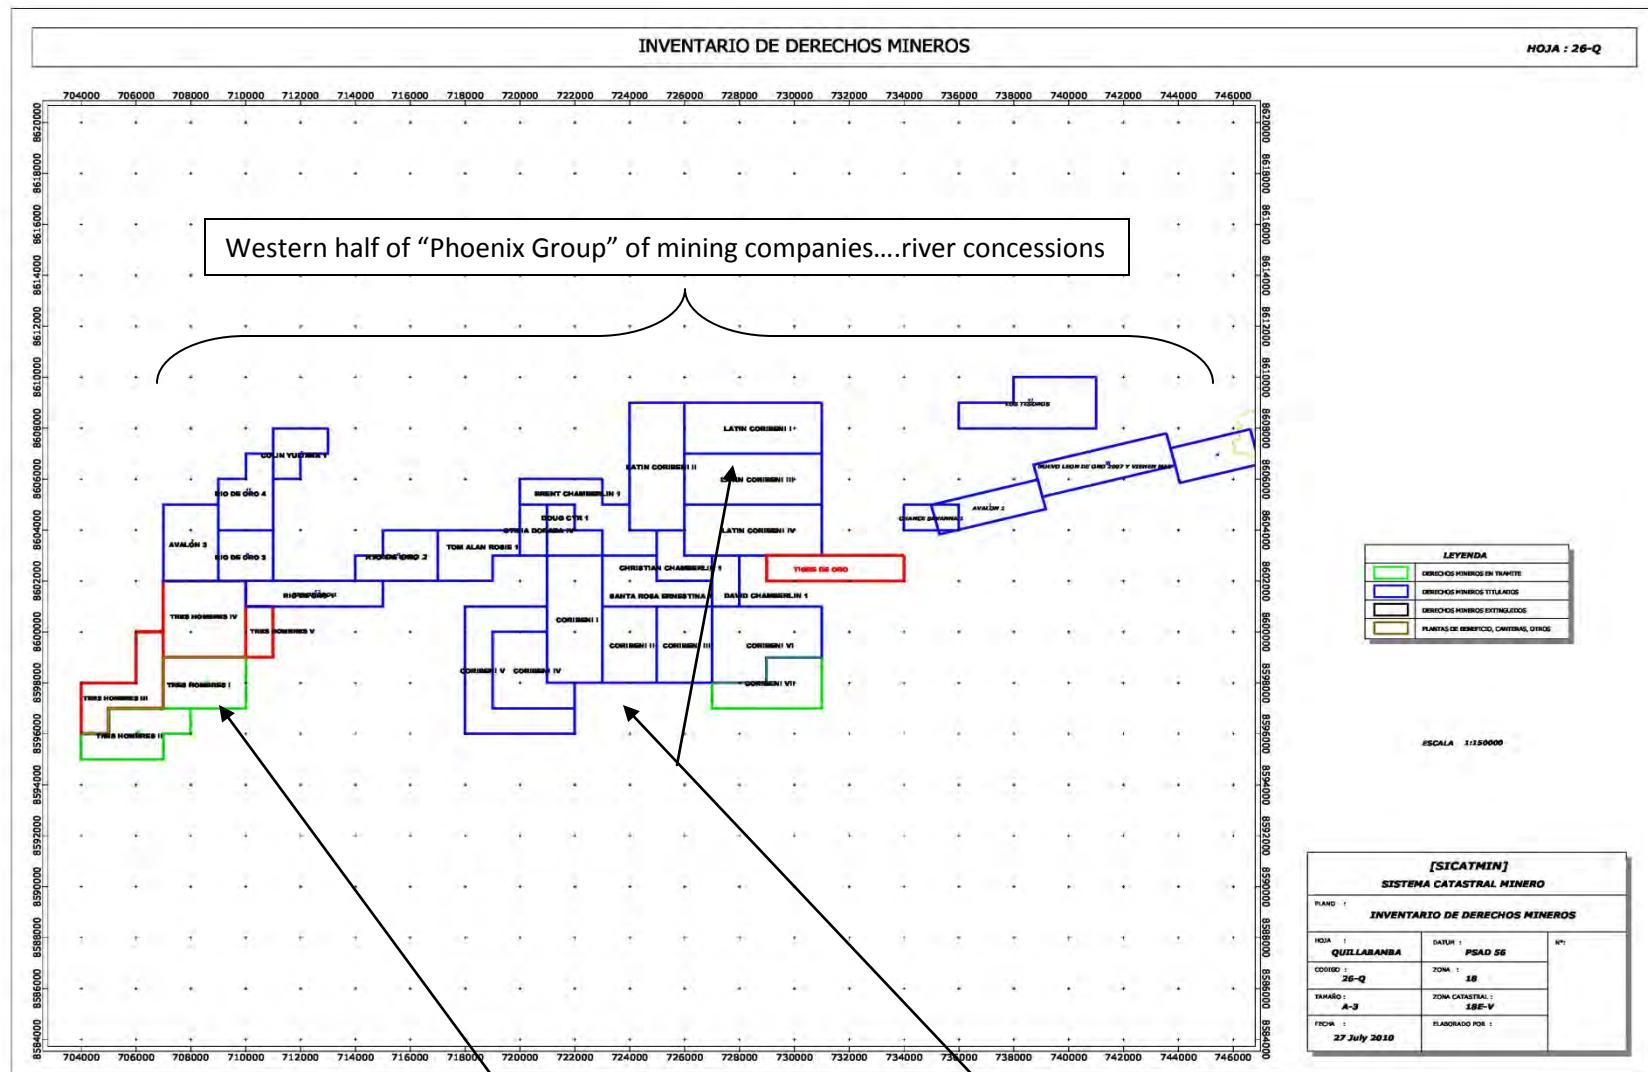

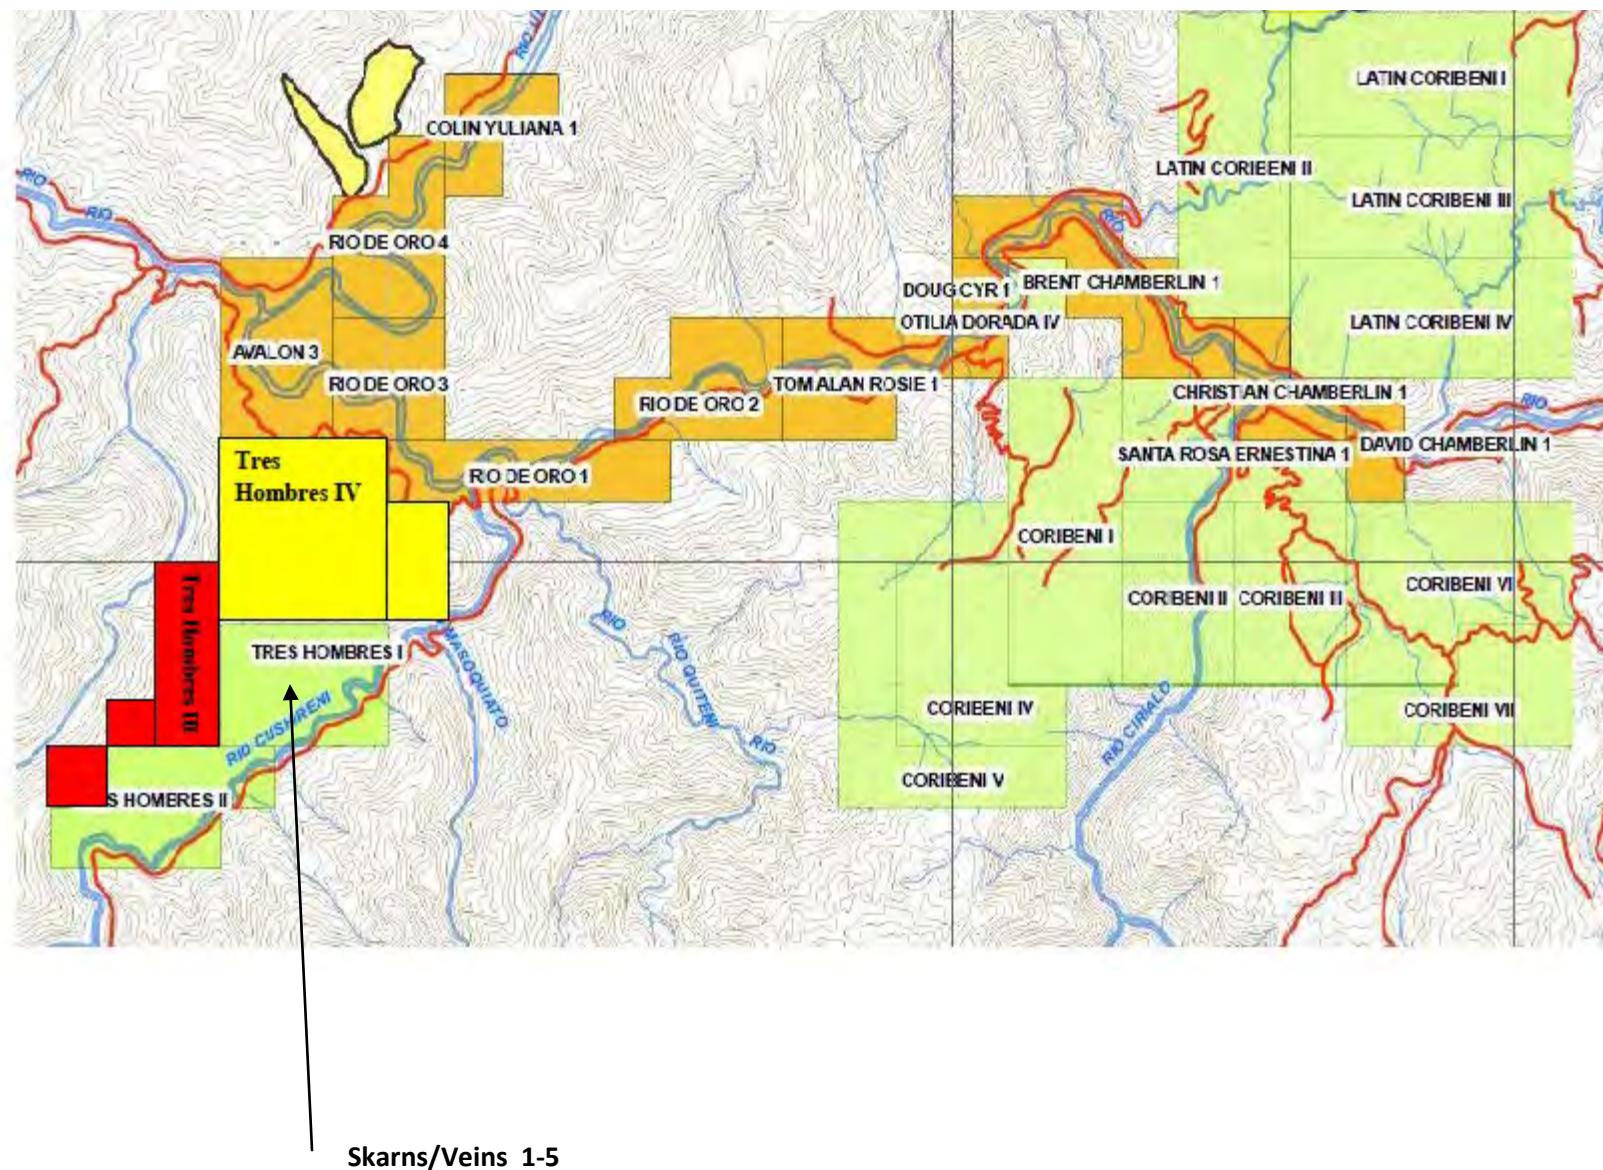

Skarn #3 Ore body Fe & Ba containing gold- silver ore

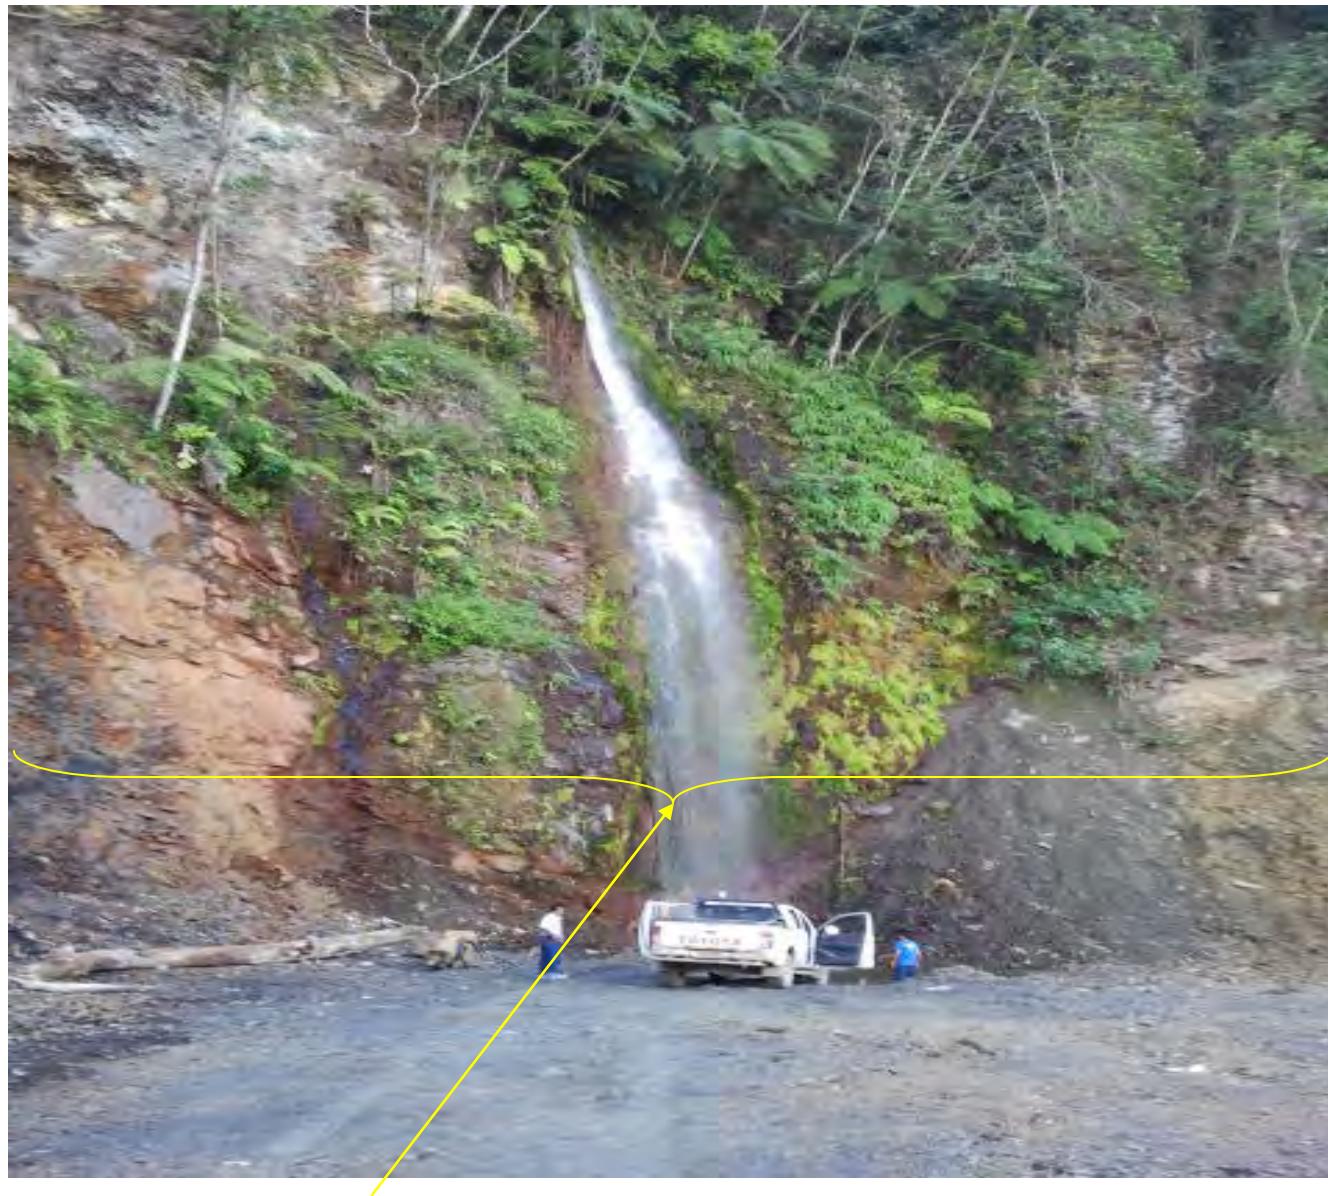

Ba (soft carbon) containing metallic veining and Fe

Skarn #1 600+ feet down hill of initial assay (1.78ozTc gold Au / 1ozTc silver Ag - Initial gold average calculated at 6-10 grams/Tc)

Excavating part of unconsolidated deposit of main ore body/skarn #1 on Tres Hombres 1 new road

Road going from river up and across the mountain thousands of feet above river road and thru Tres Hombres 1-5 mining concessions

Processing Tres Hombres 1 ore at PRG 2 plant (*4 hours up river*)

Processed material from Skarn/Veins #1 (prepared for smelter and then shipment to Swiss, Canadian and American clients)

Tres Hombres1

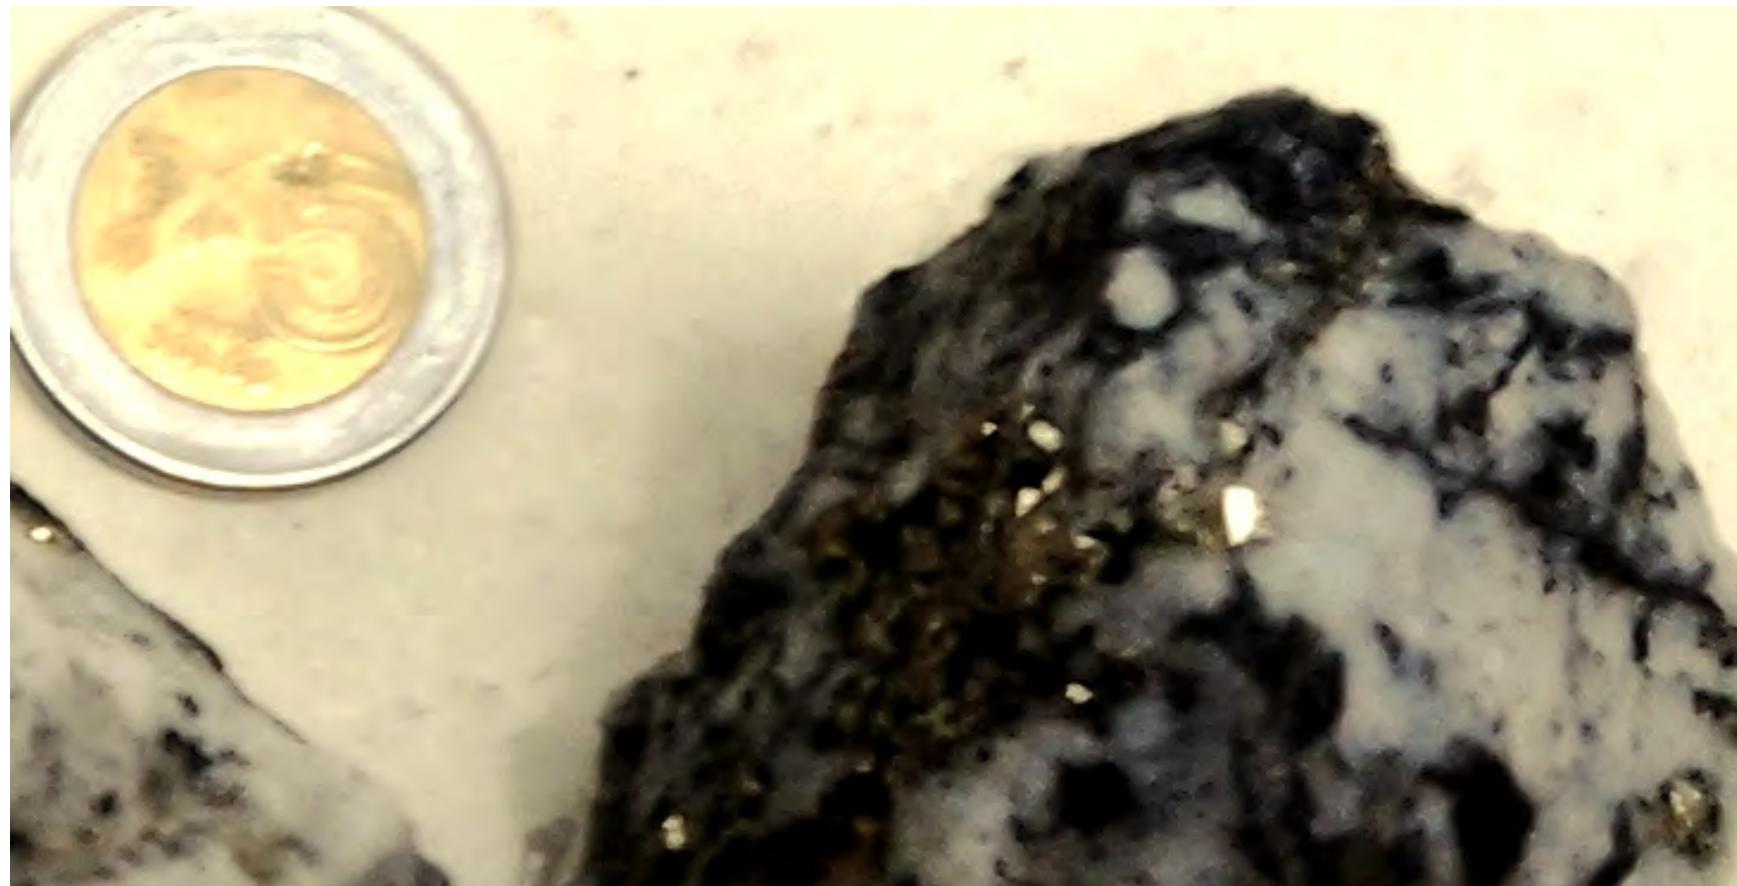

Concentrate

Large size Quartz,Carbon Pre-concentrate containing spider veins of Metallics (crushing via molinas)
